

DAY 5 · ORCHESTRATION LAYER

Copilot Studio — The Orchestration Layer

KEY TAKEAWAYS

- A custom Copilot has four pillars: Instructions (who it is), Knowledge (what it can read), Topics (what conversations it knows), and Actions (what it can do).
- Knowledge-grounded chatbots are the easiest, highest-value Copilot Studio build — point one at a single source of truth and eliminate a recurring drain on someone's calendar.
- Workflows are predictable and auditable. Agents are flexible and adaptive. You decide which your business process needs.
- Structured JSON output is the trick that turns AI prompt actions from 'sometimes useful' into 'production-grade' — every downstream step can map to a known field.
- Your Day 4 scripts and flows become Actions your Copilot can call. The Copilot becomes the conductor of the whole stack.

TOOLS YOU TOUCHED

Copilot Studio · AI prompt actions · Adaptive Cards · Dataverse · Power Automate

TRY THIS ON MONDAY

Pick one recurring question your team asks you every week. Build a knowledge-grounded Copilot in Copilot Studio for that single question. Share it with three colleagues. Iterate from there.
